Israeli-made honey aids in cancer recovery

By Lee J. Green
Deep South Jewish Voice

Israeli-developed and now available in the United States, LifeMel Honey continues to help cancer patients who are suffering from the side effects of chemotherapy. This is especially pertinent to women undergoing chemo for cancers,

including breast and ovarian.

Dr. Olga Olizki, an oncologist from the Belinson hospital in Israel, strongly recommends LifeMel to her patients. When interviewed she said, "even today, not all efforts of conventional medicine are successful. Blood transfusions and the use of new medicine help to

restore blood. But sometimes even due to all our efforts we do not achieve results and then we, the doctors, must halt the treatment and postpone it to a later date, to enable the body to recover the blood particles. The pause might allow the tumor to develop resistance to the chemicals. The usage of LifeMel honey enables continuous treatment."

Chemotherapy, while killing cancer cells, also produces side effects with serious consequences such as killing white cells, red blood cells and neutrophils (neutropenia, pancytopenia). As a result patients lose the ability to continue with the next chemotherapy treatment until the blood analysis improves. Life Mel honey is a unique product, backed by a clinical trial, which is the result of 30 years of research to help cancer patients who are suffering from the side effects of chemotherapy.

In 2006 a clinical trial was done using LifeMel Chemo

Support honey to determine its effect on chemotherapy patients who experience the side effects from the therapy itself. Chemotherapy and radiation treatments lowered the white blood cell count red blood cell count and the level of hemoglobin in these patients. More than 66 percent of the patients in the study experienced higher blood counts, were able to continue with their scheduled chemotherapy program, and generally had an improved quality of life. While it does not cure any disease it can save lives by easing the side effects and allowing patients to continue their difficult therapy. The study was published in the journal Medical Oncology in 2006 and a further clinical trial is now being conducted in Israel.

LifeMel honeys are produced from bees that are fed a special nectar consisting of natural therapeutic herbs that have for centuries been associated with healing properties.

The bees feed on this mixture. Through their natural digestive process, the ingredients and their therapeutic properties are incorporated as well as magnified into the honey. The honey is 100 percent natural.

LifeMel "Immune Support" has been developed to improve the functionality of the body's first line of support to resist infections and disease.

The immune system is highly complex and a strong and balanced immune system is required for health maintenance. The body's natural defenses can be affected by emotional and physical stress, environmental and occupational chemical exposure, radiation, infections, certain drug therapies, blood transfusions and surgery.

Dietary practices such as excessive consumption of fat, alcohol, refined sugar or insufficient levels of protein, calorie, vitamin, mineral and water can also weaken the body's natural defenses.
