

De Facto – Life Mel is effective!

What is the secret of the healing honey?

How Life Mel aids cancer patients, where the conventional medicine not entirely succeeds?

Dr. Olga Olizki, Oncologist from the BELINSON hospital explains why she strongly recommends Life Mel for her patients. [Interview]

Dr. Olga Olizki

Life Mel heals – that is no longer a secret. Many of us add honey to the tea or milk when we are cold or prepare “honey compress” to place on the chest to ease coughing. But achieving effective honey to treat oncology patients? That sounds exonerated. Nevertheless, we must give in, that when it is published by a renowned medical journal, the information must be reliable. Dr. Olga Olizki, oncologist from the BELINSON hospital is familiar with the medicinal honey, Life Mel from her professional experience. She is familiar with other medicinal honey as well. The medicinal honey is produced by “Zuf Globus” and with the help of pharmaceutical-bees. We approached Dr. Olizki to answer the questions regarding the phenomenal behavior of the pharmaceutical-bees.

What do we know about the pharmaceutical-bees? Who taught them to produce Life Mel?

Dr. Olizki: “Zuf Globus specialized in pre-configured methods for the production of medicinal honey. It all started in 1993, when the company was established in Kiryat Shmona. The company was established for the purpose of utilizing the research ideas of Dr. Alexander Goroshit, who dedicated himself to research the medicinal usage of honey.”

In the past and today still, number of people research the properties of honey.

“That is true, many people researched and still do, but Dr. Goroshit, focused his research on the production of special kind of honey. After a period of specializing in microbiology, immigrated Dr. Goroshit to Israel and based on his previous work he presented research offer to the Israeli government - ‘Research and Development - Chief Scientist’, he then offered to have ‘express development’ of medicinal honey”

What was the time scale to get results?

“In 1993 the research team succeeded to feed the bees with pre-determined bee-feed. As a result they could provide experimental quantities of medicinal honey, which had partly proved antibiotic properties and in part other medicinal properties.”

Did the honey contain the medicinal properties which were transferred from the medicinal herbs?

“Yes, since it is depends on the source of the bee-feed.”

Why it is not possible to let the bees to collect nectar from those plants, by their own?

“In most cases the medicinal substances found in the leaves, roots and stems of the plants rather than in the flowers. Those of course are inaccessible to the bees.”

The principal is now clear. So the researches had to find first the plants which can aid to oncology patients?

“Exactly. Only there is no one plant which can do that, there is a combination of plants and the synergy between them.”

What is the effective medical influence of those plants on a human being?

“The combination of the plants produces guardian to our immune system, for each disease there is a different guardian – each disease has a different spot where it attacks the immune system. Once the immune system recovers, it vigorously extinct all the viruses of that disease.”

And in the case where the bees fed on that combination of plants, then...

“They start producing the honey which will have similar powers only stronger, since the honey strengthens the effect of the plants. The biological activity of the honey is much stronger, therefore it is most effective when an immediate effect is needed.”

Does that include cancer patients?

“Yes, in the first place. When the patient receives chemotherapy, very strong cytostatics substances which also suppress the production of blood cells – which must be continuously, reproduce. So what is the effect on the patient? The leycocytes and thrombocytes

decreases to almost zero, then the anemia get stronger. To avoid this phenomenon of chemotherapy it is very hard. In the past most of the patients who were undertaking chemotherapy would pass away due to suppressing of blood cells production.”

Are there any other means to prevent this side-effect?

“Even today, not all efforts of conventional medicine are successful. Blood transfusion and the use of new medicine can help to restore the blood. But it occurs that even due to all efforts we do not achieve results and then we the doctors must halt the treatment and to postpone it to a later date, to enable the body to recover the Neutrophils and other blood particles. The pause might allow tumor to develop resistance to the chemicals. The usage of Life Mel enables continuous treatment.”

How did you hear of Life Mel?

“I read in the ‘Medical Oncology’ the article of Prof. Zidan, head of the oncology department in ZIV hospital in Zfat. The article was the clinical test of Life Mel on oncology patients. The results of the experiments proved the high effectiveness of the honey.”

Can you provide example from the results?

“Sure: the patients which took Life Mel had 44% decrease of leucopenia, the anemia decreased with 64%, and there were no side-effects. Additionally, more than third reported improve in quality of life and the general feeling.”

Does the conventional medicine have side-effects?

“Unfortunately, yes. The conventional medicine side-effects: pain in bones, weakness, sickness, allergy and fever – adding to all this

price of the conventional medicines is very high. After I analyzed the results of the clinical tests done with Life Mel, I met with the CEO of ‘Zuf Globus’ Mr. Arik Fahima. I asked all the material related to the medicinal honey, I studied the material and then started to recommend it to my patients.”

Did you do own test with yourself, same as Luois Pasteur?

“Yes I tried! Not Life Mel, cause there was any need for me, but for many of my cancer patients who takes Life Mel you see wonderful results in comparison to those who do not use Life Mel. Personally, I tried other medicinal honey, on myself and my family. I for example tried the Energy Mel – special honey to increase the body’s energy. I gave my child Easy Mel as a relaxation to reduce blood pressure, and stress. In my family we also use Gastro Mel which supports in cases of gases and pyrosis. To my patients I often recommend Fluor Mel to treat wounds in the oral cavity which occurs during chemotherapy. Medicinal honey is a good combination with the conventional medicine and they can never harm – this is the kind of therapy every doctor dreams of.
